1 String Algorithms

1.1 String Alignment

```

int pd[ms][ms];

int edit_distance(string &a, string &b) {
    int n = a.size(), m = b.size();
    for(int i = 0; i <= n; i++) pd[i][0] = i;
    for(int j = 0; j <= m; j++) pd[0][j] = j;
    for(int i = 1; i <= n; i++) {
        for(int j = 1; j <= m; j++) {
            int del = pd[i][j-1] + 1;
            int ins = pd[i-1][j] + 1;
            int mod = pd[i-1][j-1] + (a[i-1] != b[j-1]);
            pd[i][j] = min(del, min(ins, mod));
        }
    }
    return pd[n][m];
}

```

1.2 KMP

```

string p, t;
int b[ms], n, m;

void kmpPreprocess() {
    int i = 0, j = -1;
    b[0] = -1;
    while(i < m) {
        while(j >= 0 && p[i] != p[j]) j = b[j];
        b[++i] = ++j;
    }
}

void kmpSearch() {
    int i = 0, j = 0, ans = 0;
    while(i < n) {
        while(j >= 0 && t[i] != p[j]) j = b[j];
        i++; j++;
        if(j == m) {
            //ocorrencia aqui comecando em i - j
            ans++;
            j = b[j];
        }
    }
    return ans;
}

```

1.3 Trie

```

int trie[ms][sigma], terminal[ms], z;

void init() {
    memset(trie[0], -1, sizeof trie[0]);
    z = 1;
}

int get_id(char c) {
    return c - 'a';
}

void insert(string &p) {
    int cur = 0;
    for(int i = 0; i < p.size(); i++) {
        int id = get_id(p[i]);
        if(trie[cur][id] == -1) {
            memset(trie[z], -1, sizeof trie[z]);
            trie[cur][id] = z++;
        }
    }
}

```

```

        cur = trie[cur][id];
    }
    terminal[cur]++;
}

int count(string &p) {
    int cur = 0;
    for(int i = 0; i < p.size(); i++) {
        int id = get_id(p[i]);
        if(trie[cur][id] == -1) {
            return false;
        }
        cur = trie[cur][id];
    }
    return terminal[cur];
}

```

1.4 Aho-Corasick

```

// Construa a Trie do seu dicionario com o codigo acima

int fail[ms], q[ms], front, rear;

void buildFailure() {
    front = 0; rear = 0; q[rear++] = 0;
    while(front < rear) {
        int node = q[front++];
        for(int pos = 0; pos < sigma; pos++) {
            int &v = trie[node][pos];
            int f = node == 0 ? 0 : trie[fail[node]][pos];
            if(v == -1) {
                v = f;
            } else {
                fail[v] = f;
                q.push(v);
                // juntar as informacoes da borda para o V ja q um match em V implica um
                // match na borda
                terminal[v] += terminal[f];
            }
        }
    }
}

int search(string &txt) {
    int node = 0;
    int ans = 0;
    for(int i = 0; i < txt.length(); i++) {
        int pos = get_id(txt[i]);
        node = trie[node][pos];
        // processar informacoes no no atual
        ans += terminal[node];
    }
    return ans;
}

```

1.5 Algoritmo de Z

```

string s;
int fz[ms], n;

void zfunc() {
    fz[0] = n;
    for(int i = 1, l = 0, r = 0; i < n; i++) {
        if(l && i + fz[i-1] < r)
            fz[i] = fz[i-1];
        else {
            int j = min(l ? fz[i-l] : 0, i > r ? 0 : r - i);
            while(s[i+j] == s[j] && ++j);
            fz[i] = j; l = i; r = i + j;
        }
    }
}

```

2 Data Structures

2.1 BIT - Binary Indexed Tree

```

int bit[ms], n;

void update(int v, int idx) {
    while(idx <= n) {
        bit[idx] += v;
        idx += idx & -idx;
    }
}

int query(int idx) {
    int r = 0;
    while(idx > 0) {
        r += bit[idx];
        idx -= idx & -idx;
    }
    return r;
}

```

2.2 BIT 2D

```

int bit[ms][ms], n, m;

void update(int v, int x, int y) {
    while(x <= n) {
        while(y <= m) {
            bit[x][y] += v;
            y += y & -y;
        }
        x += x & -x;
    }
}

int query(int x, int y) {
    int r = 0;
    while(x > 0) {
        while(y > 0) {
            r += bit[x][y];
            y -= y & -y;
        }
        x -= x & -x;
    }
    return r;
}

```

2.3 Iterative Segment Tree

```

int n, t[2 * ms];

void build() {
    for(int i = n - 1; i > 0; --i) t[i] = t[i<<1] + t[i<<1|1];
}

void update(int p, int value) { // set value at position p
    for(t[p] += value; p > 1; p >>= 1) t[p>>1] = t[p] + t[p^1];
}

int query(int l, int r) {
    int res = 0;
    for(l += n, r += n; l < r; l >>= 1, r >>= 1) {
        if(l&1) res += t[l++];
        if(r&1) res += t[--r];
    }
    return res;
}

```

```
// If is non-commutative
S query(int l, int r) {
    S resl, resr;
    for (l += n, r += n; l < r; l >= 1, r >= 1) {
        if (l&1) resl = combine(resl, t[l++]);
        if (r&1) resr = combine(t[--r], resr);
    }
    return combine(resl, resr);
}
```

2.4 Iterative Segment Tree with Interval Updates

```
int n, t[2 * ms];

void build() {
    for(int i = n - 1; i > 0; --i) t[i] = t[i<<1] + t[i<<1|1];
}

void update(int l, int r, int value) {
    for(l += n, r += n; l < r; l >= 1, r >= 1) {
        if(l&1) t[l++] += value;
        if(r&1) t[--r] += value;
    }
}

int query(int p) {
    int res = 0;
    for(p += n; p > 0; p >= 1) res += t[p];
    return res;
}

void push() { // push modifications to leafs
    for(int i = 1; i < n; i++) {
        t[i<<1] += t[i];
        t[i<<1|1] += t[i];
        t[i] = 0;
    }
}
```

2.5 Recursive Segment Tree

```
int arr[4 * ms], seg[4 * ms], n;

void build(int idx = 0, int l = 0, int r = n - 1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    if(l == r) {
        seg[idx] = arr[l];
        return;
    }
    build(left, l, mid); build(right, mid + 1, r);
    seg[idx] = seg[left] + seg[right];
}

int query(int L, int R, int idx = 0, int l = 0, int r = n - 1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    if(R < l || L > r) return 0;
    if(L <= l && r <= R) return seg[idx];
    return query(L, R, left, l, mid) + query(L, R, right, mid + 1, r);
}

void update(int V, int I, int idx = 0, int l = 0, int r = n - 1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    if(l > I || r < I) return;
    if(l == r) {
        arr[I] = V;
        seg[idx] = V;
        return;
    }
    update(V, I, left, l, mid); update(V, I, right, mid + 1, r);
    seg[idx] = seg[left] + seg[right];
}
```

2.6 Segment Tree with Lazy Propagation

```
int arr[4 * ms], seg[4 * ms], lazy[4 * ms], n;

void build(int idx = 0, int l = 0, int r = n - 1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    if(l == r) {
        seg[idx] = arr[l];
        return;
    }
    build(left, l, mid); build(right, mid + 1, r);
    seg[idx] = seg[left] + seg[right];
}

void propagate(int idx, int l, int r, int left, int right) {
    if(lazy[idx]) {
        seg[idx] += lazy[idx] * (r - l + 1);
        if(l < r) {
            lazy[left] += lazy[idx];
            lazy[right] += lazy[idx];
        }
        lazy[idx] = 0;
    }
}

int query(int L, int R, int idx = 0, int l = 0, int r = n - 1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    propagate(idx, l, r, left, right);
    if(R < l || L > r) return 0;
    if(L <= l && r <= R) return seg[idx];
    return query(L, R, left, l, mid) + query(L, R, right, mid + 1, r);
}

void update(int V, int L, int R, int idx = 0, int l = 0, int r = n - 1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    propagate(idx, l, r, left, right);
    if(l > R || r < L) return;
    if(L <= l && r <= R) {
        lazy[idx] += V;
        propagate(idx, l, r, left, right);
        return;
    }
    update(V, L, R, left, l, mid); update(V, L, R, right, mid + 1, r);
    seg[idx] = seg[left] + seg[right];
}
```

2.7 Color Updates Structure

```
struct range {
    int l, r;
    int v;

    range(int l = 0, int r = 0, int v = 0) : l(l), r(r), v(v) {}

    bool operator < (const range &a) const {
        return l < a.l;
    }
};

set<range> ranges;

vector<range> update(int l, int r, int v) { // [l, r)
    vector<range> ans;
    if(l >= r) return ans;
    auto it = ranges.lower_bound(l);

        A = m1;
    else
        B = m2;
}
ans = inf;
for(int i = A; i <= B; i++) ans = min(ans, f(i));

```

6.4 Random Number Generator

```

// mt19937_64 se LL
mt19937 rng(chrono::steady_clock::now().time_since_epoch().count());
// Random_Shuffle
shuffle(v.begin(), v.end(), rng);
// Random number in interval
int randomInt = uniform_int_distribution(0, 1)(rng);
double randomDouble = uniform_real_distribution(0, 1)(rng);
// bernoulli_distribution, binomial_distribution, geometric_distribution
// normal_distribution, poisson_distribution, exponential_distribution

```

7 Teoremas e formulas uteis

7.1 Grafos

Formula de Euler: $V - E + F = 2$ (para grafo planar)
 Handshaking: Numero par de vertices tem grau impar
 Kirchhoff's Theorem: Monta matriz onde $M_{i,i} = \text{Grau}[i]$ e $M_{i,j} = -1$ se houver aresta $i-j$ ou 0 caso contrario, remove uma linha e uma coluna qualquer e o numero de spanning trees nesse grafo eh o det da matriz

Grafo contem caminho hamiltoniano se:
 Dirac's theorem: Se o grau de cada vertice for pelo menos $n/2$
 Ore's theorem: Se a soma dos graus que cada par nao-adjacente de vertices for pelo menos n

Trees:
 Tem Catalan(N) Binary trees de N vertices
 Tem Catalan(N-1) Arvores enraizadas com N vertices
 Cayley Formula: $n^{(n-2)}$ arvores em N vertices com label
 Prufer code: Cada etapa voce remove a folha com menor label e o label do vizinho eh adicionado ao codigo ate ter 2 vertices

Flow:
 Max Edge-disjoint paths: Max flow com arestas com peso 1
 Max Node-disjoint paths: Faz a mesma coisa mas separa cada vertice em um com as arestas de chegadas e um com as arestas de saida e uma aresta de peso 1 conectando o vertice com aresta de chegada com ele mesmo com arestas de saida
 Konig's Theorem: minimum node cover = maximum matching se o grafo for bipartido, complemento eh o maximum independent set
 Min Node disjoint path cover: formar grafo bipartido de vertices duplicados, onde aresta sai do vertice tipo A e chega em tipo B, entao o path cover eh $N - \text{matching}$
 Min General path cover: Mesma coisa mas colocando arestas de A pra B sempre que houver caminho de A pra B
 Dilworth's Theorem: Min General Path cover = Max Antichain (set de vertices tal que nao existe caminho no grafo entre vertices desse set)
 Hall's marriage: um grafo tem um matching completo do lado X se para cada subconjunto W de X, $|W| \leq |\text{vizinhos}W|$ onde $|W|$ eh quantos vertices tem em W

7.2 Math

Goldbach's: todo numero par $n > 2$ pode ser representado com $n = a + b$ onde a e b sao primos
 Twin prime: existem infinitos pares $p, p + 2$ onde ambos sao primos
 Legendre's: sempre tem um primo entre n^2 e $(n+1)^2$
 Lagrange's: todo numero inteiro pode ser inscrito como a soma de 4 quadrados
 Zeckendorf's: todo numero pode ser representado pela soma de dois numeros de fibonnaci diferentes e nao consecutivos
 Euclid's: toda tripla de pitagoras primitiva pode ser gerada com $(n^2 - m^2, 2nm, n^2 + m^2)$ onde n, m sao coprimos e um deles eh par
 Wilson's: n eh primo quando $(n-1)! \bmod n = n - 1$
 Mcnugget: Para dois coprimos x, y o maior inteiro que nao pode ser escrito como $ax + by$ eh $(x-1)(y-1)/2$

Fermat: Se p eh primo entao $a^{(p-1)} \% p = 1$
 Se x e m tambem forem coprimos entao $x^k \% m = x^{(k \bmod (m-1))} \% m$
 Euler's theorem: $x^{(\phi(m))} \bmod m = 1$ onde $\phi(m)$ eh o totiente de euler

Chinese remainder theorem:
 Para equacoes no formato $x = a_1 \bmod m_1, \dots, x = a_n \bmod m_n$ onde todos os pares m_1, \dots, m_n sao coprimos
 Deixe $X_k = m_1 * m_2 * \dots * m_n / m_k$ e $X_k^{-1} \bmod m_k = \text{inverso de } X_k \bmod m_k$, entao
 $x = \text{somatorio com k de 1 ate n de } a_k * X_k * (X_k, m_k^{-1} \bmod m_k)$
 Para achar outra solucao so somar $m_1 * m_2 * \dots * m_n$ a solucao existente

Catalan number: exemplo expressoes de parenteses bem formadas
 $C_0 = 1, C_n = \text{somatorio de } i=0 \rightarrow n-1 \text{ de } C_i * C_{(n-1-i)}$
 outra forma: $C_n = (2n \text{ escolhe } n) / (n+1)$
 Bertrand's ballot theorem: p votos tipo A e q votos tipo B com $p > q$, prob de em todo ponto ter mais As do que Bs antes dele = $(p-q) / (p+q)$
 Se puder empates entao prob = $(p+1-q) / (p+1)$, para achar quantidade de possibilidades nos dois casos basta multiplicar por $(p + q \text{ escolhe } q)$

Hockey-stick: Somatorio de $i = r \rightarrow n$ de $(i \text{ escolhe } r) = (n + 1 \text{ escolhe } r + 1)$

Vandermonde: $(m+n \text{ escolhe } r) = \text{somatorio de } k = 0 \rightarrow r \text{ de } (m \text{ escolhe } k) * (n \text{ escolhe } r - k)$

Burnside lemma: colares diferentes nao contando rotacoes quando $m = \text{cores}$ e $n = \text{comprimento}$
 $(m^n + \text{somatorio } i = 1 \rightarrow n-1 \text{ de } m^{\text{gcd}(i, n)})/n$

Distribuicao uniforme $a, a+1, \dots, b$ Expected[X] = $(a+b)/2$

Distribuicao binomial com n tentativas de probabilidade p , $X = \text{sucessos}$:
 $P(X = x) = p^x * (1-p)^{(n-x)} * (n \text{ escolhe } x)$ e $E[X] = p*n$

Distribuicao geometrica onde continuamos ate ter sucesso, $X = \text{tentativas}$:
 $P(X = x) = (1-p)^{(x-1)} * p$ e $E[X] = 1/p$

Linearity of expectation: Tendo duas variaveis X e Y e constantes a e b , o valor esperado de
 $aX + bY = a * E[X] + b * E[X]$

7.3 Geometry

Formula de Euler: $V - E + F = 2$

Pick Theorem: Para achar pontos em coords inteiras num poligono $\text{Area} = i + b/2 - 1$ onde i eh o o numero de pontos dentro do poligono e b de pontos no perimetro do poligono

Two ears theorem: Todo poligono simples com mais de 3 vertices tem pelo menos 2 orelhas, vertices que podem ser removidos sem criar um crossing, remover orelhas repetidamente triangula o poligono

Incentro triangulo: $(a(X_a, Y_a) + b(X_b, Y_b) + c(X_c, Y_c))/(a+b+c)$ onde $a = \text{lado oposto ao vertice } a$, incentro eh onde cruzam as bissetrizes, eh o centro da circunferencia inscrita e eh equidistante aos lados
