# 8 Teoremas e formulas uteis

### 8.1 Grafos

```
Formula de Euler: V - E + F = 2 (para grafo planar)
Handshaking: Numero par de vertices tem grau impar
Kirchhoff's Theorem: Monta matriz onde Mi,i = Grau[i] e Mi,j = -1 se
houver aresta i-j ou 0 caso contrario, remove uma linha e uma
coluna qualquer e o numero de spanning trees nesse grafo eh o det
da matriz
```

Dirac's theorem: Se o grau de cada vertice for pelo menos n/2 Ore's theorem: Se a soma dos graus que cada par nao-adjacente de vertices for pelo menos n

### Trees.

Tem Catalan(N-1) Arvores enraizadas com N vertices Caley Formula: n^(n-2) arvores em N vertices com label Prufer code: Cada etapa voce remove a folha com menor label e o label do vizinho eh adicionado ao codigo ate ter 2 vertices

### Flow:

Max Edge-disjoint paths: Max flow com arestas com peso 1

Tem Catalan(N) Binary trees de N vertices

Max Node-disjoint paths: Faz a mesma coisa mas separa cada vertice em um com as arestas de chegadas e um com as arestas de saida e uma aresta de peso 1 conectando o vertice com aresta de chegada com ele mesmo com arestas de saida

Konig's Theorem: minimum node cover = maximum matching se o grafo for bipartido, complemento en o maximum independent set

Min Node disjoint path cover: formar grafo bipartido de vertices duplicados, onde aresta sai do vertice tipo A e chega em tipo B, entao o path cover eh N - matching

Min General path cover: Mesma coisa mas colocando arestas de A pra B sempre que houver caminho de A pra B

Dilworth's Theorem: Min General Path cover = Max Antichain (set de vertices tal que nao existe caminho no grafo entre vertices desse

Hall's marriage: um grafo tem um matching completo do lado X se para cada subconjunto W de X,

 $|W| \leftarrow |vizinhosW|$  onde |W| eh quantos vertices tem em W

### 8.2 Math

Goldbach's: todo numero par n > 2 pode ser representado com n = a + bonde a e b sao primos

Twin prime: existem infinitos pares p, p + 2 onde ambos sao primos Legendre's: sempre tem um primo entre n^2 e (n+1)^2

Lagrange's: todo numero inteiro pode ser inscrito como a soma de 4 quadrados

Zeckendorf's: todo numero pode ser representado pela soma de dois numeros de fibonnacis diferentes e nao consecutivos

Euclid's: toda tripla de pitagoras primitiva pode ser gerada com  $(n^2 - m^2, 2nm, n^2+m^2)$  onde n, m sao coprimos e um deles eh par Wilson's:  $n \in primo quando (n-1)! \mod n = n - 1$ 

Mcnugget: Para dois coprimos x, y o maior inteiro que nao pode ser escrito como ax + by eh (x-1)(y-1)/2

Fermat: Se p eh primo entao  $a^(p-1) % p = 1$ Se  $x \in m$  tambem forem coprimos entao  $x^k % m = x^(k \mod(m-1)) % m$ Euler's theorem: x^(phi(m)) mod m = 1 onde phi(m) eh o totiente de euler

Chinese remainder theorem:

Para equacoes no formato  $x = a1 \mod m1$ , ...,  $x = an \mod mn$  onde todos os pares m1, ..., mn sao coprimos

Deixe  $Xk = m1 * m2 * .. * mn/mk e Xk^-1 mod mk = inverso de Xk mod mk, entao$  $x = somatorio com k de 1 ate n de ak*Xk*(Xk,mk^-1 mod mk)$ 

Para achar outra solucao so somar m1\*m2\*..\*mn a solucao existente

Catalan number: exemplo expressoes de parenteses bem formadas

```
C0 = 1, Cn = somatorio de <math>i=0 \rightarrow n-1 de Ci*C(n-1+1)
outra forma: Cn = (2n \text{ escolhe } n)/(n+1)
Bertrand's ballot theorem: p votos tipo A e q votos tipo B com p>q,
    prob de em todo ponto ter mais As do que Bs antes dele = (p-q)/(p+
Se puder empates entao prob = (p+1-q)/(p+1), para achar quantidade de
    possibilidades nos dois casos basta multiplicar por (p + q escolhe
Propriedades de Coeficientes Binomiais:
Somatorio de k = 0 \rightarrow m de (-1)^k \star (n \text{ escolhe } k) = (-1)^m \star (n -1)
     escolhe m)
(N \text{ escolhe } K) = (N \text{ escolhe } N-K)
(N \text{ escolhe } K) = N/K * (n-1 \text{ escolhe } k-1)
Somatorio de k = 0 \rightarrow n de (n escolhe k) = 2^n
Somatorio de m = 0 \rightarrow n de (m \text{ escolhe } k) = (n+1 \text{ escolhe } k+1)
Somatorio de k = 0 \rightarrow m de (n+k) escolhe k) = (n+m+1) escolhe m)
Somatorio de k = 0 \rightarrow n de (n \text{ escolhe } k)^2 = (2n \text{ escolhe } n)
Somatorio de k = 0 ou 1 \rightarrow n de k*(n escolhe k) = n * 2^(n-1)
Somatorio de k = 0 \rightarrow n de (n-k \text{ escolhe } k) = \text{Fib}(n+1)
Hockey-stick: Somatorio de i = r \rightarrow n de (i escolhe r) = (n + 1)
    escolhe r + 1)
Vandermonde: (m+n \text{ escolhe r}) = \text{somatorio de } k = 0 -> r \text{ de } (m \text{ escolhe } k
    ) \star (n escolhe r - k)
Burnside lemma: colares diferentes nao contando rotações quando m =
    cores e n = comprimento
(m^n + somatorio i = 1 - > n-1 de m^gcd(i, n))/n
Distribuicao uniforme a,a+1, ..., b Expected[X] = (a+b)/2
Distribuicao binomial com n tentativas de probabilidade p, X =
    P(X = x) = p^x * (1-p)^(n-x) * (n escolhe x) e E[X] = p*n
Distribuicao geometrica onde continuamos ate ter sucesso, X =
    tentativas:
    P(X = x) = (1-p)^(x-1) * p e E[X] = 1/p
Linearity of expectation: Tendo duas variaveis X e Y e constantes a e
```

# 8.3 Geometry

Formula de Euler: V - E + F = 2Pick Theorem: Para achar pontos em coords inteiras num poligono Area = i + b/2 - 1 onde i eh o o numero de pontos dentro do poligono e b de pontos no perimetro do poligono Two ears theorem: Todo poligono simples com mais de 3 vertices tem pelo menos 2 orelhas, vertices que podem ser removidos sem criar um crossing, remover orelhas repetidamente triangula o poligono Incentro triangulo: (a(Xa, Ya) + b(Xb, Yb) + c(Xc, Yc))/(a+b+c) onde a = lado oposto ao vertice a, incentro eh onde cruzam as bissetrizes, eh o centro da circunferencia inscrita e eh

### 8.4 Mersenne's Primes

equidistante aos lados

Primos de Mersenne 2^n - 1 Lista de Ns que resultam nos primeiros 41 primos de Mersenne:

b, o valor esperado de aX + bY = a\*E[X] + b\*E[X]
