1 String Algorithms

1.1 String Alignment

```
int pd[ms][ms];
int edit_distance(string &a, string &b) {
   int n = a.size(), m = b.size();
   for(int i = 0; i <= n; i++) pd[i][0] = i;
   for(int j = 0; j <= m; j++) pd[0][j] = j;
   for(int i = 1; i <= n; i++) {
      for(int j = 1; j <= m; j++) {
       int del = pd[i][j-1] + 1;
       int ins = pd[i-1][j] + 1;
       int mod = pd[i-1][j-1] + (a[i-1] != b[j-1]);
      pd[i][j] = min(del, min(ins, mod));
    }
}
return pd[n][m];
}</pre>
```

1.2 KMP

```
string p, t;
int b[ms], n, m;
void kmpPreprocess() {
  int i = 0, j = -1;
  b[0] = -1;
  while (i < m) {
    while (j \ge 0 \&\& p[i] != p[j]) j = b[j];
    b[++i] = ++j;
void kmpSearch() {
  int i = 0, j = 0, ans = 0;
  while (i < n) {
    while (j \ge 0 \&\& t[i] != p[j]) j = b[j];
    <u>i</u>++; j++;
    if(j == m) {
      //ocorrencia agui comecando em i - j
      ans++;
      j = b[j];
  return ans;
```

1.3 Trie

```
int trie[ms][sigma], terminal[ms], z;
void init() {
 memset(trie[0], -1, sizeof trie[0]);
 z = 1;
int get_id(char c) {
  return c - 'a';
void insert(string &p) {
  int cur = 0;
  for(int i = 0; i < p.size(); i++) {</pre>
    int id = get_id(p[i]);
    if(trie[cur][id] == -1)
      memset(trie[z], -1, sizeof trie[z]);
      trie[cur][id] = z++;
    cur = trie[cur][id];
  terminal[cur]++;
int count(string &p) {
  int cur = 0;
  for(int i = 0; i < p.size(); i++) {</pre>
    int id = get_id(p[i]);
    if(trie[cur][id] == -1) {
      return false;
    cur = trie[cur][id];
  return terminal[cur];
```

} } int search(string &txt) { int node = 0; int ans = 0; for(int i = 0; i < txt.length(); i++) { int pos = get_id(txt[i]); node = trie[node][pos]; // processar informacoes no no atual ans += terminal[node]; } return ans; }</pre>

1.5 Algoritmo de Z

```
string s;
int fz[ms], n;

void zfunc() {
  fz[0] = n;
  for(int i = 1, l = 0, r = 0; i < n; i++) {
    if(l && i + fz[i-l] < r)
        fz[i] = fz[i-l];
    else {
        int j = min(l ? fz[i-l] : 0, i > r ? 0 : r - i);
        while(s[i+j] == s[j] && ++j);
        fz[i] = j; l = i; r = i + j;
    }
}
```

1.4 Aho-Corasick

```
// Construa a Trie do seu dicionario com o codigo acima
int fail[ms];
queue<int> q;
void buildFailure() {
  q.push(0);
  while(!q.empty()) {
    int node = q.front();
    q.pop();
    for(int pos = 0; pos < sigma; pos++) {</pre>
      int &v = trie[node][pos];
      int f = node == 0 ? 0 : trie[fail[node]][pos];
      if(v == -1) {
       v = f:
      } else {
       fail[v] = f;
        q.push(v);
        // juntar as informacoes da borda para o V ja q um match em V
            implica um match na borda
        terminal[v] += terminal[f];
```

1.6 Suffix Array

```
namespace SA {
  typedef pair<int, int> ii;
  vector<int> buildSA(string s) {
    int n = (int) s.size();
    vector<int> ids(n), pos(n);
    vector<ii>> pairs(n);
    for (int i = 0; i < n; i++) {
      ids[i] = i;
      pairs[i] = ii(s[i], -1);
    sort(ids.begin(), ids.end(), [&](int a, int b) -> bool {
      return pairs[a] < pairs[b];</pre>
    });
    int on = 0:
    for(int i = 0; i < n; i++) {</pre>
      if (i && pairs[ids[i - 1]] != pairs[ids[i]]) on++;
      pos[ids[i]] = on;
    for(int offset = 1; offset < n; offset <<= 1) {</pre>
      //ja tao ordenados pelos primeiros offset caracteres
      for(int i = 0; i < n; i++) {
```

```
pairs[i].first = pos[i];
        if (i + offset < n) {
          pairs[i].second = pos[i + offset];
          pairs[i].second = -1;
      sort(ids.begin(), ids.end(), [&](int a, int b) -> bool {
        return pairs[a] < pairs[b];</pre>
      });
      int on = 0;
      for (int i = 0; i < n; i++) {
        if (i && pairs[ids[i - 1]] != pairs[ids[i]]) on++;
        pos[ids[i]] = on;
   return ids;
  vector<int> buildLCP(string s, vector<int> sa) {
   int n = (int) s.size();
   vector<int> pos(n), lcp(n, 0);
    for (int i = 0; i < n; i++) {
      pos[sa[i]] = i;
   int k = 0;
    for(int i = 0; i < n; i++) {</pre>
      if (pos[i] + 1 == n) {

      while(i + k < n && j + k < n && s[i + k] == s[j + k]) k++;
      lcp[pos[i]] = k;
      k = \max(k - 1, 0);
   return lcp;
};
```

2 Data Structures

2.1 BIT - Binary Indexed Tree

```
int bit[ms], n;

void update(int v, int idx) {
  while(idx <= n) {
    bit[idx] += v;
    idx += idx & -idx;
  }
}

int query(int idx) {
  int r = 0;
  while(idx > 0) {
    r += bit[idx];
    idx -= idx & -idx;
}
```

```
}
return r;
```

2.2 BIT 2D

```
int bit[ms][ms], n, m;

void update(int v, int x, int y) {
    while(x <= n) {
        bit[x][y] += v;
        y += y&-y;
        }
        x += x&-x;
    }
}

int query(int x, int y) {
    int r = 0;
    while(x > 0) {
        while(y > 0) {
            r += bit[x][y];
            y -= y&-y;
        }
        x -= x&-x;
    }

    return r;
}
```

2.3 BIT 2D Comprimida

```
// by TFG
#include <vector>
#include <utility>
#include <algorithm>
typedef std::pair<int, int> ii;
struct Bit2D {
public:
  Bit2D(std::vector<ii> pts) {

private:
  set<Line> hull;
```

7 Miscellaneous

7.1 LIS - Longest Increasing Subsequence

```
int arr[ms], lisArr[ms], n;
// int bef[ms], pos[ms];

int lis() {
   int len = 1;
   lisArr[0] = arr[0];
   // bef[0] = -1;
   for(int i = 1; i < n; i++) {
        // upper_bound se non-decreasing</pre>
```

```
int x = lower_bound(lisArr, lisArr + len, arr[i]) - lisArr;
len = max(len, x + 1);
lisArr[x] = arr[i];
// pos[x] = i;
// bef[i] = x ? pos[x-1] : -1;
}
return len;
}

vi getLis() {
  int len = lis();
  vi ans;
  for(int i = pos[lisArr[len - 1]]; i >= 0; i = bef[i]) {
    ans.push_back(arr[i]);
}
reverse(ans.begin(), ans.end());
return ans;
}
```

7.2 Binary Search

```
int smallestSolution() {
  int x = -1;
  for(int b = z; b >= 1; b /= 2) {
    while(!ok(x+b)) x += b;
  }
  return x + 1;
}

int maximumValue() {
  int x = -1;
  for(int b = z; b >= 1; b /= 2) {
    while(f(x+b) < f(x+b+1)) x += b;
  }
  return x + 1;
}</pre>
```

7.3 Ternary Search

```
// R
for(int i = 0; i < LOG; i++) {
  long double m1 = (A * 2 + B) / 3.0;
  long double m2 = (A + 2 * B) / 3.0;

  if(f(m1) > f(m2))
      A = m1;
  else
      B = m2;
}
ans = f(A);

// Z
while(B - A > 4) {
  int m1 = (A + B) / 2;
  int m2 = (A + B) / 2 + 1;
  if(f(m1) > f(m2))
      A = m1;
  else
```

```
B = m2;
}
ans = inf;
for(int i = A; i <= B; i++) ans = min(ans , f(i));</pre>
```

7.4 Random Number Generator

7.5 Submask Enumeration

```
for (int s=m; ; s=(s-1)&m) {
    ... you can use s ...
    if (s==0) break;
}
```

7.6 Java Fast I/O

```
import java.util.*;
import java.io.*;
// https://www.spoj.com/problems/INTEST/
class Main{
  public static void main(String[] args) throws Exception{
    Reader s = new Reader();
    PrintWriter out = new PrintWriter(new BufferedOutputStream(System.
        out));
    int n = s.nextInt();
    int k = s.nextInt();
    int count=0;
    while (s.hasNext()) {
      int x = s.nextInt();
      if (x%k == 0)
      count++;
    out.printf("%d\n", count);
    out.close();
    s.close();
  // fast io
  static class Reader {
    final private int BUFFER SIZE = 1 << 16:
    private DataInputStream din;

  return buffer[bufferPointer++];
public void close() throws IOException {
 if (din == null) return;
 din.close();
```

8 Teoremas e formulas uteis

8.1 Grafos

```
Formula de Euler: V - E + F = 2 (para grafo planar)
Handshaking: Numero par de vertices tem grau impar
Kirchhoff's Theorem: Monta matriz onde Mi, i = Grau[i] e Mi, j = -1 se
    houver aresta i-j ou O caso contrario, remove uma linha e uma
    coluna qualquer e o numero de spanning trees nesse grafo eh o det
    da matriz
Grafo contem caminho hamiltoniano se:
Dirac's theorem: Se o grau de cada vertice for pelo menos n/2
Ore's theorem: Se a soma dos graus que cada par nao-adjacente de
    vertices for pelo menos n
Trees:
Tem Catalan(N) Binary trees de N vertices
Tem Catalan (N-1) Arvores enraizadas com N vertices
Calev Formula: n^(n-2) arvores em N vertices com label
Prufer code: Cada etapa voce remove a folha com menor label e o label
    do vizinho eh adicionado ao codigo ate ter 2 vertices
Flow:
Max Edge-disjoint paths: Max flow com arestas com peso 1
Max Node-disjoint paths: Faz a mesma coisa mas separa cada vertice em
    um com as arestas de chegadas e um com as arestas de saida e uma
```

- aresta de peso 1 conectando o vertice com aresta de chegada com ele mesmo com arestas de saida
- Konig's Theorem: minimum node cover = maximum matching se o grafo for bipartido, complemento eh o maximum independent set
- Min Node disjoint path cover: formar grafo bipartido de vertices duplicados, onde aresta sai do vertice tipo A e chega em tipo B, entao o path cover eh N matching
- Min General path cover: Mesma coisa mas colocando arestas de A pra B sempre que houver caminho de A pra B
- Dilworth's Theorem: Min General Path cover = Max Antichain (set de vertices tal que nao existe caminho no grafo entre vertices desse set)
- Hall's marriage: um grafo tem um matching completo do lado X se para cada subconjunto W de X,
 - |W| <= |vizinhosW| onde |W| eh quantos vertices tem em W

8.2 Math

- Goldbach's: todo numero par n > 2 pode ser representado com n = a + b onde a e b sao primos
- Twin prime: existem infinitos pares p, p + 2 onde ambos sao primos Legendre's: sempre tem um primo entre n^2 e $(n+1)^2$
- Lagrange's: todo numero inteiro pode ser inscrito como a soma de 4
 quadrados
- Zeckendorf's: todo numero pode ser representado pela soma de dois numeros de fibonnacis diferentes e nao consecutivos
- Euclid's: toda tripla de pitagoras primitiva pode ser gerada com $(n^2 m^2, 2nm, n^2+m^2)$ onde n, m sao coprimos e um deles eh par Wilson's: n eh primo quando (n-1)! mod n = n 1
- Mcnugget: Para dois coprimos x, y o maior inteiro que nao pode ser escrito como ax + by eh (x-1)(y-1)/2
- Fermat: Se p eh primo entao a(p-1) % p = 1
- Se x e m tambem forem coprimos entao x^k % $m = x^k$ (k mod(m-1)) % m Euler's theorem: x^k (phi(m)) mod m = 1 onde phi(m) eh o totiente de euler
- Chinese remainder theorem:
- Para equacoes no formato x = a1 mod m1, ..., x = an mod mn onde todos os pares m1, ..., mn sao coprimos
- Deixe Xk = m1*m2*..*mn/mk e Xk^-1 mod mk = inverso de Xk mod mk, entao x = somatorio com k de 1 ate n de $ak*Xk*(Xk,mk^-1 \mod mk)$
- Para achar outra solucao so somar m1*m2*..*mn a solucao existente
- Catalan number: exemplo expressoes de parenteses bem formadas C0 = 1, Cn = somatorio de i=0 -> n-1 de Ci*C(n-1+1)
- outra forma: Cn = (2n escolhe n) / (n+1)
- Bertrand's ballot theorem: p votos tipo A e q votos tipo B com p>q, prob de em todo ponto ter mais As do que Bs antes dele = (p-q)/(p+q)

- Se puder empates entao prob = (p+1-q)/(p+1), para achar quantidade de possibilidades nos dois casos basta multiplicar por (p + q) escolhe (p)
- Hockey-stick: Somatorio de $i = r \rightarrow n$ de (i escolhe r) = (n + 1 escolhe r + 1)
- Vandermonde: $(m+n \text{ escolhe } r) = \text{somatorio de } k = 0 \rightarrow r \text{ de } (m \text{ escolhe } k) * (n \text{ escolhe } r k)$
- Burnside lemma: colares diferentes nao contando rotacoes quando m =
 cores e n = comprimento
- $(m^n + somatorio i = 1 > n-1 de m^qcd(i, n))/n$
- Distribuicao uniforme a,a+1, ..., b Expected[X] = (a+b)/2 Distribuicao binomial com n tentativas de probabilidade p, X =
- successos: $P(X = x) = p^x * (1-p)^n(n-x) * (n \text{ escolhe } x) \in E[X] = p*n$
- P(X = x) = p^x * (1-p)^(n-x) * (n escolhe x) e E[X] = p*n
 Distribuicao geometrica onde continuamos ate ter sucesso, X =
 tentativas:
 - $P(X = x) = (1-p)^(x-1) * p e E[X] = 1/p$
- Linearity of expectation: Tendo duas variaveis $X \in Y$ e constantes a e b, o valor esperado de aX + bY = a*E[X] + b*E[X]

8.3 Geometry

- Formula de Euler: V E + F = 2
- Pick Theorem: Para achar pontos em coords inteiras num poligono Area = i + b/2 1 onde i eh o o numero de pontos dentro do poligono e b de pontos no perimetro do poligono
- Two ears theorem: Todo poligono simples com mais de 3 vertices tem pelo menos 2 orelhas, vertices que podem ser removidos sem criar um crossing, remover orelhas repetidamente triangula o poligono
- Incentro triangulo: (a(Xa, Ya) + b(Xb, Yb) + c(Xc, Yc))/(a+b+c) onde
 a = lado oposto ao vertice a, incentro eh onde cruzam as
 bissetrizes, eh o centro da circunferencia inscrita e eh
 equidistante aos lados

8.4 Mersenne's Primes

- Primos de Mersenne 2^n 1
- Lista de Ns que resultam nos primeiros 41 primos de Mersenne: 2; 3; 5; 7; 13; 17; 19; 31; 61; 89; 107; 127; 521; 607; 1.279; 2.203; 2.281; 3.217; 4.253; 4.423; 9.689; 9.941; 11.213; 19.937; 21.701; 23.209; 44.497; 86.243; 110.503; 132.049; 216.091; 756.839; 859.433; 1.257.787; 1.398.269; 2.976.221; 3.021.377; 6.972.593; 13.466.917; 20.996.011; 24.036.583;
