The AC is a lie - ICPC Library

Contents

1 String Algorithms

1.1 String Alignment

```cpp
int pd[ms][ms];

int edit_distance(string &a, string &b) {
    int n = a.size(), m = b.size();
    for(int i = 0; i <= n; i++) pd[i][0] = i;
    for(int j = 0; j <= m; j++) pd[0][j] = j;
    for(int i = 1; i <= n; i++) {
        for(int j = 1; j <= m; j++) {
            int del = pd[i][j-1] + 1;
            int ins = pd[i-1][j] + 1;
            int mod = pd[i-1][j-1] + (a[i-1] != b[j-1]);
            pd[i][j] = min(del, min(ins, mod));
        }
    }
    return pd[n][m];
}
```

1.2 KMP

```cpp
string p, t;
int b[ms], n, m;

void kmpPreprocess() {
    int i = 0, j = -1;
    b[0] = -1;
    while(i < m) {
        while(j >= 0 && p[i] != p[j]) j = b[j];
        b[++i] = ++j;
    }
}

void kmpSearch() {
    int i = 0, j = 0, ans = 0;
    while(i < n) {
        while(j >= 0 && t[i] != p[j]) j = b[j];
        i++; j++;
        if(j == m) {
            //ocorrencia aqui comecando em i - j
            ans++;
            j = b[j];
        }
    }
    return ans;
}
```

1.3 Trie

```cpp
int trie[ms][sigma], terminal[ms], z;

void init() {
    memset(trie[0], -1, sizeof trie[0]);
    z = 1;
}

int get_id(char c) {
    return c - 'a';
}

void insert(string &p) {
    int cur = 0;
    for(int i = 0; i < p.size(); i++) {
        int id = get_id(p[i]);
        if(trie[cur][id] == -1) {
            memset(trie[z], -1, sizeof trie[z]);
            trie[cur][id] = z++;
        }
        cur = trie[cur][id];
    }
    terminal[cur]++;
}

int count(string &p) {
    int cur = 0;
    for(int i = 0; i < p.size(); i++) {
        int id = get_id(p[i]);
        if(trie[cur][id] == -1) {
            return false;
        }
        cur = trie[cur][id];
    }
    return terminal[cur];
}
```

1.4 Aho-Corasick

```cpp
// Construa a Trie do seu dicionario com o codigo acima

int fail[ms];
queue<int> q;

void buildFailure() {
    q.push(0);
    while(!q.empty()) {
        int node = q.front();
        q.pop();
        for(int pos = 0; pos < sigma; pos++) {
            int &v = trie[node][pos];
            int f = node == 0 ? 0 : trie[fail[node]][pos];
            if(v == -1) {
                v = f;
            } else {
                fail[v] = f;
                q.push(v);
                // juntar as informacoes da borda para o V ja q um
                //     match em V implica um match na borda
                terminal[v] += terminal[f];
            }
        }
    }
}

int search(string &txt) {
    int node = 0;
    int ans = 0;
    for(int i = 0; i < txt.length(); i++) {
        int pos = get_id(txt[i]);
        node = trie[node][pos];
        // processar informacoes no no atual
        ans += terminal[node];
    }
    return ans;
}
```

1.5 Algoritmo de Z

```cpp
string s;
int fz[ms], n;

void zfunc() {
  fz[0] = n;
  for(int i = 1, l = 0, r = 0; i < n; i++) {
    if(l &&  i + fz[i-l] < r)
      fz[i] = fz[i-l];
    else {
        int j = min(l ? fz[i-l] : 0, i > r ? 0 : r - i);
        while(s[i+j] == s[j] && ++j);
        fz[i] = j; l = i; r = i + j;
    }
  }
}
```

1.6 Suffix Array

```cpp
namespace SA {
        typedef pair<int, int> ii;

        vector<int> buildSA(string s) {
                int n = (int) s.size();
                vector<int> ids(n), pos(n);
                vector<ii> pairs(n);
                for(int i = 0; i < n; i++) {
                        ids[i] = i;
                        pairs[i] = ii(s[i], -1);
                }
                sort(ids.begin(), ids.end(), [&](int a, int b) -> bool
                    {
                        return pairs[a] < pairs[b];
                });
                int on = 0;
                for(int i = 0; i < n; i++) {
                        if (i && pairs[ids[i - 1]] != pairs[ids[i]])
                            on++;
                        pos[ids[i]] = on;
                }
                for(int offset = 1; offset < n; offset <<= 1) {
```

```cpp
            //ja tao ordenados pelos primeiros offset
                caracteres
            for(int i = 0; i < n; i++) {
                    pairs[i].first = pos[i];
                    if (i + offset < n) {
                            pairs[i].second = pos[i +
                                offset];
                    } else {
                            pairs[i].second = -1;
                    }
            }
            sort(ids.begin(), ids.end(), [&](int a, int b)
                -> bool {
                    return pairs[a] < pairs[b];
            });
            int on = 0;
            for(int i = 0; i < n; i++) {
                    if (i && pairs[ids[i - 1]] != pairs[
                        ids[i]]) on++;
                    pos[ids[i]] = on;
            }
        }
        return ids;
    }

    vector<int> buildLCP(string s, vector<int> sa) {
        int n = (int) s.size();
        vector<int> pos(n), lcp(n, 0);
        for(int i = 0; i < n; i++) {
                pos[sa[i]] = i;
        }
        int k = 0;
        for(int i = 0; i < n; i++) {
                if (pos[i] + 1 == n) {

                        continue;
                }
                int j = sa[pos[i] + 1];
                while(i + k < n && j + k < n && s[i + k] == s[
                    j + k]) k++;
                lcp[pos[i]] = k;
                k = max(k - 1, 0);
        }
        return lcp;
    }
};
```

2 Data Structures

2.1 BIT - Binary Indexed Tree

```cpp
int bit[ms], n;

void update(int v, int idx) {
    while(idx <= n) {
        bit[idx] += v;
        idx += idx & -idx;
    }
}
```

```cpp
}
int query(int idx) {
    int r = 0;
    while(idx > 0) {
        r += bit[idx];
        idx -= idx & -idx;
    }
    return r;
}
```

2.2 BIT 2D

```cpp
int bit[ms][ms], n, m;

void update(int v, int x, int y) {
    while(x <= n) {
        while(y <= m) {
            bit[x][y] += v;
            y += y&-y;
        }
        x += x&-x;
    }
}

int query(int x, int y) {
    int r = 0;
    while(x > 0) {
        while(y > 0) {
            r += bit[x][y];
            y -= y&-y;
        }
        x -= x&-x;
    }
    return r;
}
```

2.3 BIT 2D Comprimida

```cpp
// by TFG
#include <vector>
#include <utility>
#include <algorithm>

typedef std::pair<int, int> ii;

struct Bit2D {
public:
        Bit2D(std::vector<ii> pts) {
                std::sort(pts.begin(), pts.end());
                for(auto a : pts) {
                        if(ord.empty() || a.first != ord.back())
                                ord.push_back(a.first);
                }
                fw.resize(ord.size() + 1);
                coord.resize(fw.size());
                for(auto &a : pts)
                        std::swap(a.first, a.second);
```

```cpp
        std::sort(pts.begin(), pts.end());
        for(auto &a : pts) {
                std::swap(a.first, a.second);
                for(int on = std::upper_bound(ord.begin(), ord
                        .end(), a.first) - ord.begin(); on < fw.
                        size(); on += on & -on) {
                                if(coord[on].empty() || coord[on].back
                                        () != a.second);
                                        coord[on].push_back(a.second);
                        }
        }
        for(int i = 0; i < fw.size(); i++) {
                fw[i].assign(coord[i].size() + 1, 0);
        }
    }

    void upd(int x, int y, int v) {
        for(int xx = std::upper_bound(ord.begin(), ord.end(),
            x) - ord.begin(); xx < fw.size(); xx += xx & -xx)
            {

                        (), coord[xx].end(), y) - coord[xx].begin
                        (); yy > 0; yy -= yy & -yy) {
                        ans += fw[xx][yy];
                }
        }
        return ans;
    }
private:
        std::vector<int> ord;
        std::vector<std::vector<int>> fw, coord;
};
```

2.4 Iterative Segment Tree

```cpp
int n, t[2 * ms];

void build() {
    for(int i = n - 1; i > 0; --i) t[i] = t[i<<1] + t[i<<1|1];
}

void update(int p, int value) { // set value at position p
    for(t[p += n] = value; p > 1; p >>= 1) t[p>>1] = t[p] + t[p^1];
}

int query(int l, int r) {
    int res = 0;
    for(l += n, r += n; l < r; l >>= 1, r >>= 1) {
```

```cpp
        if(l&1) res += t[l++];
        if(r&1) res += t[--r];
    }
    return res;
}

// If is non-commutative
S query(int l, int r) {
  S resl, resr;
  for (l += n, r += n; l < r; l >>= 1, r >>= 1) {
    if (l&1) resl = combine(resl, t[l++]);
    if (r&1) resr = combine(t[--r], resr);
  }
  return combine(resl, resr);
}
```

2.5 Iterative Segment Tree with Interval Updates

```cpp
int n, t[2 * ms];

void build() {
    for(int i = n - 1; i > 0; --i) t[i] = t[i<<1] + t[i<<1|1];
}

void update(int l, int r, int value) {
    for(l += n, r += n; l < r; l >>= 1, r >>= 1) {
        if(l&1) t[l++] += value;
        if(r&1) t[--r] += value;
    }
}

int query(int p) {
    int res = 0;
    for(p += n; p > 0; p >>= 1) res += t[p];
    return res;
}

void push() { // push modifications to leafs
    for(int i = 1; i < n; i++) {
        t[i<<1] += t[i];
        t[i<<1|1] += t[i];
        t[i] = 0;
    }
}
```

2.6 Recursive Segment Tree

```cpp
int arr[4 * ms], seg[4 * ms], n;

void build(int idx = 0, int l = 0, int r = n - 1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    if(l == r) {
        seg[idx] = arr[l];
        return;
    }
    build(left, l, mid); build(right, mid + 1, r);
    seg[idx] = seg[left] + seg[right];
}
```

```cpp
int query(int L, int R, int idx = 0, int l = 0, int r = n - 1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    if(R < l || L > r) return 0;
    if(L <= l && r <= R) return seg[idx];
    return query(L, R, left, l, mid) + query(L, R, right, mid + 1, r);
}

void update(int V, int I, int idx = 0, int l = 0, int r = n -1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    if(l > I || r < I) return;
    if(l == r) {
        arr[I] = V;
        seg[idx] = V;
        return;
    }
    update(V, I, left, l, mid); update(V, I, right, mid + 1, r);
    seg[idx] = seg[left] + seg[right];
}
```

2.7 Segment Tree with Lazy Propagation

```cpp
int arr[4 * ms],  seg[4 * ms], lazy[4 * ms], n;

void build(int idx = 0, int l = 0, int r = n - 1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    lazy[idx] = 0;
    if(l == r) {
        seg[idx] = arr[l];
        return;
    }
    build(left, l, mid); build(right, mid + 1, r);
    seg[idx] = seg[left] + seg[right];
}

void propagate(int idx, int l, int r) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    if(lazy[idx]) {
        seg[idx] += lazy[idx] * (r - l + 1);
        if(l < r) {
            lazy[2*idx+1] += lazy[idx];
            lazy[2*idx+2] += lazy[idx];
        }
        lazy[idx] = 0;
    }
}

int query(int L, int R, int idx = 0, int l = 0, int r = n - 1) {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    propagate(idx, l, r);
    if(R < l || L > r) return 0;
    if(L <= l && r <= R) return seg[idx];
    return query(L, R, left, l, mid) + query(L, R, right, mid + 1, r);
}

void update(int V, int L, int R, int idx = 0, int l = 0, int r = n -1)
        {
    int mid = (l+r)/2, left = 2 * idx + 1, right = 2 * idx + 2;
    propagate(idx, l, r);
    if(l > R || r < L) return;
```

```cpp
    if(L <= l && r <= R) {
        lazy[idx] += V;
        propagate(idx, l, r);
        return;
    }
    update(V, L, R, left, l, mid); update(V, L, R, right, mid + 1, r);
    seg[idx] = seg[left] + seg[right];
}
```

2.8 Persistent Segment Tree

```cpp
struct PSEGTREE{
    private:
        int z, t, sz, *tree, *L, *R, head[112345];

        void _build(int l, int r, int on, vector<int> &v){
            if(l == r){
                tree[on] = v[l];
                return;
            }
            L[on] = ++z;
            int mid = (l+r)>>1;
            _build(l, mid, L[on], v);
            R[on] = ++z;
            _build(mid+1, r, R[on], v);
            tree[on] = tree[L[on]] + tree[R[on]];
        }

        int _upd(int ql, int qr, int val, int l, int r, int on
            ){
            if(l > qr || r < ql) return on;
            int curr = ++z;
            if(l >= ql && r <= qr){
                tree[curr] = tree[on] + val;
                return curr;
            }
            int mid = (l+r)>>1;

        ptsInv.insert(swapCoord(p[i]));
    }
    return d;
}
```

5.4 Intersection Points

```cpp
// Utiliza uma seg tree

int intersectionPoints(vector<pair<PT, PT>> v) {
    int n = v.size();
    vector<pair<int, int>> events, vertInt;
    for(int i = 0; i < n; i++) {
        if(v.first.x == v.second.x) { // Segmento Vertical
            int y0 = min(v.first.y, v.second.y), y1 = max(v.first.y, v
                .second.y);
            events.push_back({v.first.x, vertInt.size()}); // Tipo =
                Indice no array
            vertInt.push_back({y0, y1});
        } else { // Segmento Horizontal
            int x0 = min(v.first.x, v.second.x), x1 = max(v.first.x, v
                .second.x);
            events.push_back({x0, -1}); // Inicio de Segmento
            events.push_back({x1, inf}); // Final de Segmento
        }
    }
    sort(events.begin(), events.end());
    int ans = 0;
    for(int i = 0; i < events.size(); i++) {
        int t = events[i].second;
        if(t == -1) {
            segUpdate(events[i].first, 1);
        } else if(t == inf) {
            segUpdate(events[i].first, 0);
        } else {
            ans += segQuery(vertInt[t].first, vertInt[t].second);
        }
    }
    return ans;
}
```

5.5 Java Geometry Library

```java
import java.util.*;
import java.io.*;
import java.awt.geom.*;
import java.lang.*;
//Lazy Geometry
class AWT{
    static Area makeArea(double[] pts){
        Path2D.Double p = new Path2D.Double();
        p.moveTo(pts[0], pts[1]);
        for(int i = 2; i < pts.length; i+=2){
            p.lineTo(pts[i], pts[i+1]);
        }
        p.closePath();
        return new Area(p);
    }
    static double computePolygonArea(ArrayList<Point2D.Double>
        points) {
        Point2D.Double[] pts = points.toArray(new Point2D.
            Double[points.size()]);
        double area = 0;
        for (int i = 0; i < pts.length; i++){
            int j = (i+1) % pts.length;
            area += pts[i].x * pts[j].y - pts[j].x * pts[i
                ].y;
        }
        return Math.abs(area)/2;
    }
    static double computeArea(Area area) {
        double totArea = 0;
        PathIterator iter = area.getPathIterator(null);
        ArrayList<Point2D.Double> points = new ArrayList<
            Point2D.Double>();
        while (!iter.isDone()) {

            switch (iter.currentSegment(buffer)) {
                case PathIterator.SEG_MOVETO:
                case PathIterator.SEG_LINETO:
                    points.add(new Point2D.Double(
                        buffer[0], buffer[1]));
                    break;
                case PathIterator.SEG_CLOSE:
                    totArea += computePolygonArea(
                        points);
                    points.clear();
                    break;
            }
            iter.next();
        }
        return totArea;
    }
}
```

6 Dynamic Programming

6.1 Convex Hull Trick

```cpp
typedef long double double_t;
typedef long long int ll;

class HullDynamic {
public:
    const double_t inf = 1e9;

    struct Line {
        ll m, b;
        double_t start;
        bool is_query;

        Line() {}

        Line(ll _m, ll _b, double_t _start, bool _is_query) : m(_m), b
            (_b), start(_start), is_query(_is_query) {}

        ll eval(ll x) {
            return m * x + b;
        }

        double_t intersect(const Line& l) const {
```

```cpp
        return (double_t) (l.b - b) / (m - l.m);
    }

    bool operator< (const Line& l) const {
        if (is_query == 0) return m > l.m;
        return (start < l.start);
    }
};

typedef set<Line>::iterator iterator_t;

bool has_prev(iterator_t it) {
    return (it != hull.begin());
}

bool has_next(iterator_t it) {
    return (++it != hull.end());
}

        return;
    }
    update_left(it);
    it = hull.lower_bound(f);
    update_right(it);
}

ll get(ll x) {
    Line f(0, 0, x, 1);
    iterator_t it = hull.upper_bound(f);
    assert(it != hull.begin());
    --it;
    return it->m * x + it->b;
}

private:
    set<Line> hull;
};
```

---

7 Miscellaneous

7.1 LIS - Longest Increasing Subsequence

```cpp
int arr[ms], lisArr[ms], n;
// int bef[ms], pos[ms];

int lis() {
    int len = 1;
    lisArr[0] = arr[0];
    // bef[0] = -1;
    for(int i = 1; i < n; i++) {
        // upper_bound se non-decreasing
```

```cpp
        int x = lower_bound(lisArr, lisArr + len, arr[i]) - lisArr;
        len = max(len, x + 1);
        lisArr[x] = arr[i];
        // pos[x] = i;
        // bef[i] = x ? pos[x-1] : -1;
    }
    return len;
}

vi getLis() {
    int len = lis();
    vi ans;
    for(int i = pos[lisArr[len - 1]]; i >= 0; i = bef[i]) {
        ans.push_back(arr[i]);
    }
    reverse(ans.begin(), ans.end());
    return ans;
}
```

7.2 Binary Search

```cpp
int smallestSolution() {
    int x = -1;
    for(int b = z; b >= 1; b /= 2) {
        while(!ok(x+b)) x += b;
    }
    return x + 1;
}

int maximumValue() {
    int x = -1;
    for(int b = z; b >= 1; b /= 2) {
        while(f(x+b) < f(x+b+1)) x += b;
    }
    return x + 1;
}
```

7.3 Ternary Search

```cpp
// R
for(int i = 0; i < LOG; i++){
    long double m1 = (A * 2 + B) / 3.0;
    long double m2 = (A + 2 * B) / 3.0;

    if(f(m1) > f(m2))
        A = m1;
    else
        B = m2;
}
ans = f(A);

// Z
while(B - A > 4){
    int m1 = (A + B) / 2;
    int m2 = (A + B) / 2 + 1;
    if(f(m1) > f(m2))
        A = m1;
    else
```

```cpp
        B = m2;
}
ans = inf;
for(int i = A; i <= B; i++) ans = min(ans , f(i));
```

7.4 Random Number Generator

```cpp
// mt19937_64 se LL
mt19937 rng(chrono::steady_clock::now().time_since_epoch().count());
// Random_Shuffle
shuffle(v.begin(), v.end(), rng);
// Random number in interval
int randomInt = uniform_int_distribution(0, i)(rng);
double randomDouble = uniform_real_distribution(0, 1)(rng);
// bernoulli_distribution, binomial_distribution,
    geometric_distribution
// normal_distribution, poisson_distribution, exponential_distribution
```

7.5 Submask Enumeration

```cpp
for (int s=m; ; s=(s-1)&m) {
    ... you can use s ...
    if (s==0) break;
}
```

7.6 Java Fast I/O

```java
import java.util.*;
import java.io.*;
// https://www.spoj.com/problems/INTEST/
class Main{
    public static void main(String[] args) throws Exception{
        Reader s = new Reader();
        PrintWriter out = new PrintWriter(new
            BufferedOutputStream(System.out));
        int n = s.nextInt();
        int k = s.nextInt();
        int count=0;
        while (s.hasNext()) {
            int x = s.nextInt();
            if (x%k == 0)
                count++;
        }
        out.printf("%d\n", count);
        out.close();
        s.close();
    }
    // fast io
    static class Reader {
        final private int BUFFER_SIZE = 1 << 16;

```

8   Teoremas e formulas uteis

8.1   Grafos

```
Formula de Euler: V - E + F = 2 (para grafo planar)
Handshaking: Numero par de vertices tem grau impar
Kirchhoff's Theorem: Monta matriz onde Mi,i = Grau[i] e Mi,j = -1 se
    houver aresta i-j ou 0 caso contrario, remove uma linha e uma
    coluna qualquer e o numero de spanning trees nesse grafo eh o det
    da matriz

Grafo contem caminho hamiltoniano se:
Dirac's theorem: Se o grau de cada vertice for pelo menos n/2
Ore's theorem: Se a soma dos graus que cada par nao-adjacente de
    vertices for pelo menos n

Trees:
Tem Catalan(N) Binary trees de N vertices
Tem Catalan(N-1) Arvores enraizadas com N vertices
Caley Formula: n^(n-2) arvores em N vertices com label
Prufer code: Cada etapa voce remove a folha com menor label e o label
    do vizinho eh adicionado ao codigo ate ter 2 vertices
```

Flow:
Max Edge-disjoint paths: Max flow com arestas com peso 1
Max Node-disjoint paths: Faz a mesma coisa mas separa cada vertice em
    um com as arestas de chegadas e um com as arestas de saida e uma
    aresta de peso 1 conectando o vertice com aresta de chegada com
    ele mesmo com arestas de saida
Konig's Theorem: minimum node cover = maximum matching se o grafo for
    bipartido, complemento eh o maximum independent set
Min Node disjoint path cover: formar grafo bipartido de vertices
    duplicados, onde aresta sai do vertice A e chega em tipo B,
    entao o path cover eh N - matching
Min General path cover: Mesma coisa mas colocando arestas de A pra B
    sempre que houver caminho de A pra B
Dilworth's Theorem: Min General Path cover = Max Antichain (set de
    vertices tal que nao existe caminho no grafo entre vertices desse
    set)
Hall's marriage: um grafo tem um matching completo do lado X se para
    cada subconjunto W de X,
    |W| <= |vizinhosW| onde |W| eh quantos vertices tem em W

8.2   Math

Goldbach's: todo numero par n > 2 pode ser representado com n = a + b
    onde a e b sao primos
Twin prime: existem infinitos pares p, p + 2 onde ambos sao primos
Legendre's: sempre tem um primo entre n^2 e $(n+1)^2$
Lagrange's: todo numero inteiro pode ser inscrito como a soma de 4
    quadrados
Zeckendorf's: todo numero pode ser representado pela soma de dois
    numeros de fibonnacis diferentes e nao consecutivos
Euclid's: toda tripla de pitagoras primitiva pode ser gerada com
    $(n^2 - m^2, 2nm, n^2+m^2)$ onde n, m sao coprimos e um deles eh par
Wilson's: n eh primo quando (n-1)! mod n = n - 1
Mcnugget: Para dois coprimos x, y o maior inteiro que nao pode ser
    escrito como ax + by eh (x-1)(y-1)/2

Fermat: Se p eh primo entao $a^{(p-1)}$ % p = 1
Se x e m tambem forem coprimos entao x^k % m = $x^{(k \bmod (m-1))}$ % m
Euler's theorem: $x^{(phi(m))}$ mod m = 1 onde phi(m) eh o totiente de
    euler

Chinese remainder theorem:
Para equacoes no formato x = a1 mod m1, ... , x = an mod mn onde todos
    os pares m1, ... , mn sao coprimos
Deixe Xk = m1*m2*..*mn/mk e Xk^{-1} mod mk = inverso de Xk mod mk, entao
x = somatorio com k de 1 ate n de ak*Xk*(Xk,mk^{-1} mod mk)
Para achar outra solucao so somar m1*m2*..*mn a solucao existente

Catalan number: exemplo expressoes de parenteses bem formadas
C0 = 1, Cn = somatorio de i=0 -> n-1 de Ci*C(n-1+1)
outra forma: Cn = (2n escolhe n)/(n+1)

Bertrand's ballot theorem: p votos tipo A e q votos tipo B com p>q,
    prob de em todo ponto ter mais As do que Bs antes dele = (p-q)/(p+
    q)
Se puder empates entao prob = (p+1-q)/(p+1), para achar quantidade de
    possibilidades nos dois casos basta multiplicar por (p + q escolhe
    q)

Hockey-stick: Somatorio de i = r -> n de (i escolhe r) = (n + 1
    escolhe r + 1)
Vandermonde: (m+n escolhe r) = somatorio de k = 0 -> r de (m escolhe k
) * (n escolhe r - k)

Burnside lemma: colares diferentes nao contando rotacoes quando m =
    cores e n = comprimento
(m^n + somatorio i =1 - > n-1 de $m^{gcd(i, n)}$)/n

Distribuicao uniforme a,a+1, ..., b Expected[X] = (a+b)/2
Distribuicao binomial com n tentativas de probabilidade p, X =
    sucessos:
    P(X = x) = p^x * $(1-p)^{(n-x)}$ * (n escolhe x) e E[X] = p*n
Distribuicao geometrica onde continuamos ate ter sucesso, X =
    tentativas:
    P(X = x) = $(1-p)^{(x-1)}$ * p e E[X] = 1/p
Linearity of expectation: Tendo duas variaveis X e Y e constantes a e
    b, o valor esperado de aX + bY = a*E[X] + b*E[X]

8.3   Geometry

Formula de Euler: V - E + F = 2
Pick Theorem: Para achar pontos em coords inteiras num poligono Area =
    i + b/2 - 1 onde i eh o o numero de pontos dentro do poligono e b
    de pontos no perimetro do poligono
Two ears theorem: Todo poligono simples com mais de 3 vertices tem
    pelo menos 2 orelhas, vertices que podem ser removidos sem criar
    um crossing, remover orelhas repetidamente triangula o poligono
Incentro triangulo: (a(Xa, Ya) + b(Xb, Yb) + c(Xc, Yc))/(a+b+c) onde
    a = lado oposto ao vertice a, incentro eh onde cruzam as
    bissetrizes, eh o centro da circunferencia inscrita e eh
    equidistante aos lados

8.4   Mersenne's Primes

Primos de Mersenne $2^n - 1$
Lista de Ns que resultam nos primeiros 41 primos de Mersenne:
2; 3; 5; 7; 13; 17; 19; 31; 61; 89; 107; 127; 521; 607; 1.279; 2.203;
    2.281; 3.217; 4.253; 4.423; 9.689; 9.941; 11.213; 19.937; 21.701;
    23.209; 44.497; 86.243; 110.503; 132.049; 216.091; 756.839;
    859.433; 1.257.787; 1.398.269; 2.976.221; 3.021.377; 6.972.593;
    13.466.917; 20.996.011; 24.036.583;
